To whom it may concern

This is to confirm that the Beam central vacuum cleaner SC 3500 has a cyclonic system like all other Beam units. The cyclonic system is needed to slow the air speed enabling the dust to fall down in the dirt container.

All Beam central vacuum cleaners have the cyclonic system as a standard feature, and the purpose is to reduce the air speed allowing the dust and dirt to drop into the dust container. However, in order to fully protect the motor the Beam central vacuum cleaners - including the SC 3500 - are equipped with a Goretex self cleaning filter catching those particles being so light that they do not drop into the dust container even though the air speed has been reduced by the cyclonic system.

In case this statement raises any questions and/or comments please do not hesitate to contact the signer.

Best regards,
Electrolux Central Vacuum Systems
